

# Become early tester of RespectUs

Updated: Nov 22, 2022

## RespectUs - Release of the first 3 modules

## We are happy to announce the release of our first three export control compliance modules

RespectUs is building the next generation platform for Export Control Compliance for Space companies and exporters/suppliers of sensitive items. Our platform offers an integrated service with an "all you need to know" approach towards exporting your goods and products. The platform will be composed of 7 individual modules ranging from a vast Knowledge Base of export control regulations, product classification tools, up-to-date sanctions and embargoes lists, customer screening and end-use checks, risk assessment and license determination solutions for the export of sensitive items and technology.

Our team has put forth the first three modules recently:

- **Knowledge Base** where we provide a comprehensive overview of all up to date export control legal frameworks divided by countries for an effortless user experience, starting with Luxembourg and the EU

- **Risk Assessment** tool that determines an overall business risk score depending on your company, customers, products in subject and export control practices to provide you a customized insight into your risk exposure for export control violations
- **License Determination** which enables to find out if a specific operation, dealing with a product, an end-user and a destination country, is anyway restricted and/or subject to authorisation. In reality, this process serves to be very tedious and our platform is just making license determination a whole lot easier.

Now is a chance for you to be our very first early users to test our export control platform for FREE. [Send us an email](#) and discover the modules right now.
